

# Four Output Differential Buffer for PCle Gen 1 and Gen 2

ICS9DB403D

## **Description**

The ICS9DB403 is compatible with the Intel DB400v2 Differential Buffer Specification. This buffer provides 4 PCI-Express Gen2 clocks. The ICS9DB403 is driven by a differential output pair from a CK410B+, CK505 or CK509B main clock generator.

## **Output Features**

- 4 0.7V current-mode differential output pairs
- · Supports zero delay buffer mode and fanout mode
- Bandwidth programming available
- 50-100 MHz operation in PLL mode
- 50-400 MHz operation in Bypass mode

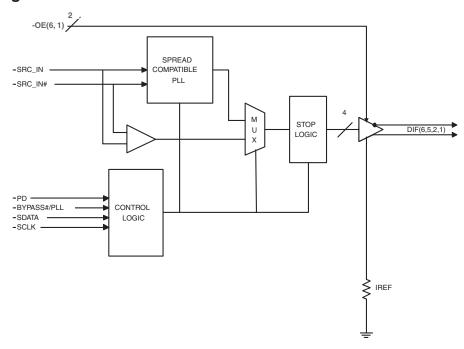

#### Features/Benefits

- Spread spectrum modulation tolerant, 0 to -0.5% down spread and +/- 0.25% center spread.
- Supports undriven differential outputs in PD# and SRC\_STOP# modes for power management.

## **Key Specifications**

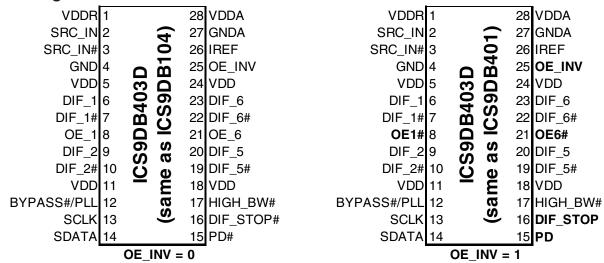

- Outputs cycle-cycle jitter < 50ps</li>
- Outputs skew: 50ps
- Phase jitter: PCle Gen1 < 86ps peak to peak
- Phase jitter: PCIe Gen2 < 3.0/3.1ps rms
- 28-pin SSOP/TSSOP pacakge
- · Available in RoHS compliant packaging
- Supports Commercial (0 to +70°C) and Industrial (-40 to +85°C) temperature ranges

## **Functional Block Diagram**

Note: Polarities shown for OE INV = 0.

## **Pin Configuration**

## 28-pin SSOP & TSSOP

## **Polarity Inversion Pin List Table**

## General SMBus serial interface information for the ICS9DB403D

## **How to Write:**

- · Controller (host) sends a start bit.
- Controller (host) sends the write address DC (h)
- ICS clock will acknowledge
- Controller (host) sends the begining byte location = N
- ICS clock will acknowledge
- Controller (host) sends the data byte count = X
- ICS clock will acknowledge
- Controller (host) starts sending Byte N through Byte N + X -1
- ICS clock will acknowledge each byte one at a time
- Controller (host) sends a Stop bit

## How to Read:

- · Controller (host) will send start bit.
- Controller (host) sends the write address DC (h)
- ICS clock will acknowledge
- Controller (host) sends the begining byte location = N
- ICS clock will acknowledge
- Controller (host) will send a separate start bit.
- Controller (host) sends the read address DD (h)
- ICS clock will acknowledge
- ICS clock will send the data byte count = X
- ICS clock sends Byte N + X -1
- ICS clock sends Byte 0 through byte X (if X<sub>(h)</sub> was written to byte 8).
- Controller (host) will need to acknowledge each byte
- Controllor (host) will send a not acknowledge bit
- · Controller (host) will send a stop bit

Note: Polarities in timing diagrams are shown OE\_INV = 0. They are similar to OE\_INV = 1.

#### PD#, Power Down

The PD# pin cleanly shuts off all clocks and places the device into a power saving mode. PD# must be asserted before shutting off the input clock or power to insure an orderly shutdown. PD is asynchronous active-low input for both powering down the device and powering up the device. When PD# is asserted, all clocks will be driven high, or tri-stated (depending on the PD# drive mode and Output control bits) before the PLL is shut down.

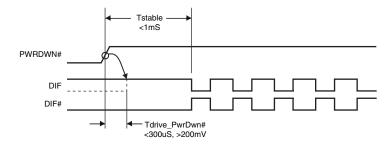

#### **PD# Assertion**

When PD# is sampled low by two consecutive rising edges of DIF#, all DIF outputs must be held High, or tri-stated (depending on the PD# drive mode and Output control bits) on the next High-Low transition of the DIF# outputs. When the PD# drive mode bit is set to '0', all clock outputs will be held with DIF driven High with 2 x I<sub>REF</sub> and DIF# tri-stated. If the PD# drive mode bit is set to '1', both DIF and DIF# are tri-stated.

#### PD# De-assertion

Power-up latency is less than 1 ms. This is the time from de-assertion of the PD# pin, or VDD reaching 3.3V, or the time from valid SRC\_IN clocks until the time that stable clocks are output from the device (PLL Locked). If the PD# drive mode bit is set to '1', all the DIF outputs must driven to a voltage of >200 mV within 300 us of PD# de-assertion.

#### SRC\_STOP#

The SRC\_STOP# signal is an active-low asynchronous input that cleanly stops and starts the DIF outputs. A valid clock must be present on SRC\_IN for this input to work properly. The SRC\_STOP# signal is de-bounced and must remain stable for two consecutive rising edges of DIF# to be recognized as a valid assertion or de-assertion.

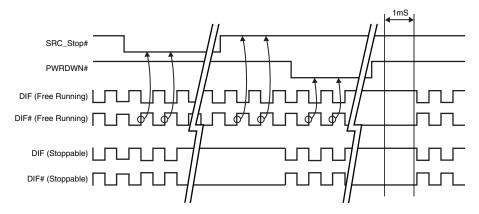

#### SRC STOP# - Assertion

Asserting SRC\_STOP# causes all DIF outputs to stop after their next transition (if the control register settings allow the output to stop). When the SRC\_STOP# drive bit is '0', the final state of all stopped DIF outputs is DIF = High and DIF# = Low. There is no change in output drive current. DIF is driven with  $6x_{REF}$  DIF# is not driven, but pulled low by the termination. When the SRC\_STOP# drive bit is '1', the final state of all DIF output pins is Low. Both DIF and DIF# are not driven.

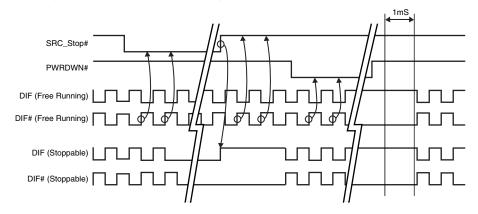

## SRC\_STOP# - De-assertion (transition from '0' to '1')

All stopped differential outputs resume normal operation in a glitch-free manner. The de-assertion latency to active outputs is 2-6 DIF clock periods, with all DIF outputs resuming simultaneously. If the SRC\_STOP# drive control bit is '1' (tri-state), all stopped DIF outputs must be driven High (>200 mV) within 10 ns of de-assertion.

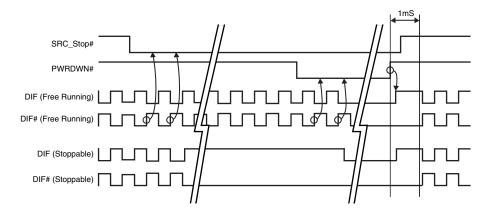

### SRC\_STOP\_1 (SRC\_Stop = Driven, PD = Driven)

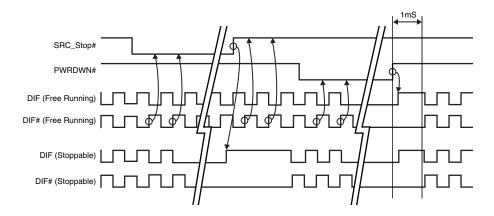

## SRC\_STOP\_2 (SRC\_Stop =Tristate, PD = Driven)

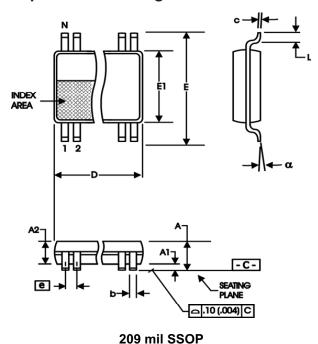

## **SRC\_STOP\_3** (**SRC\_Stop** = **Driven**, **PD** = **Tristate**)

## SRC\_STOP\_4 (SRC\_Stop = Tristate, PD = Tristate)

# **Ordering Information**

| Part / Order Number | Marking     | Shipping Packaging | Package      | Temperature   |
|---------------------|-------------|--------------------|--------------|---------------|
| 9DB403DGLF          | 9DB403DGLF  | Tubes              | 28-pin TSSOP | 0 to +70° C   |
| 9DB403DGLFT         | 9DB403DGLF  | Tape and Reel      | 28-pin TSSOP | 0 to +70° C   |
| 9DB403DGILF         | 9DB403DGILF | Tubes              | 28-pin TSSOP | -40 to +85° C |
| 9DB403DGILFT        | 9DB403DGILF | Tape and Reel      | 28-pin TSSOP | -40 to +85° C |
| 9DB403DFLF          | 9DB403DFLF  | Tubes              | 28-pin SSOP  | 0 to +70° C   |
| 9DB403DFLFT         | 9DB403DFLF  | Tape and Reel      | 28-pin SSOP  | 0 to +70° C   |
| 9DB403DFILF         | 9DB403DFILF | Tubes              | 28-pin SSOP  | -40 to +85° C |
| 9DB403DFILFT        | 9DB403DFILF | Tape and Reel      | 28-pin SSOP  | -40 to +85° C |

<sup>&</sup>quot;LF" denotes Pb-free package, RoHS compliant

<sup>&</sup>quot;D" is the revision designator (will not correlate to datasheet revision)

## ICS9DB403D Four Output Differential Buffer for PCle Gen 1 and Gen 2

# **Revision History**

| Rev.        | Issue Date | Description  | Page #  |
|-------------|------------|--|---------|
| I           | 11/26/2008 | Updated SMBus table - Byte0:Byte3.   | 11      |
| J           | 2/6/2009   | Added Industrial temp. specs and ordering information.                       | Various |
| K           | 7/13/2009  | Updated general description and block diagram                                | 1       |
|             |            | 1. Clarified that Vih and Vil values were for Single ended inputs            |         |
|             |            | 2. Added separate Idd values for the 9DB403                                  |         |
| L           | 10/7/2009  | 3. Added Differential Clock input parameters.                                | Various |
| М           | 1/27/2011  | Updated Termination Figure 4   | 10      |
|             |            | 1. Update pin 1 pin-name and pin description from VDD to VDDR. This          |         |
|             |            | highlights that optimal peformance is obtained by treating VDDR as in analog |         |
| Ν           | 5/6/2011   | pin. This is a document update only, there is no silicon change.             | Various |
| Р           | 8/27/2012  | Updated Vswing conditions to include "single-ended measurement"              | 5       |
|             |            | Updated Byte 2, bits 1, 2, 5 and 6 per char review. Outputs can be           |         |
| Q           | 9/18/2012  | programmed with Byte 2 to be Stoppable or Free-Run with DIF_Stop pin, not    | 12      |
|             |            | the OE pins.   |         |
| R 11/1/2012 |            | Updated Input-to-Output Skew max value (Bypass Mode condition only) from     | 7       |
|             |            | 4500ps to 5000ps per latest characterization data.                           | /       |
