To our customers,

## Old Company Name in Catalogs and Other Documents

On April $1^{\text {st }}, 2010$, NEC Electronics Corporation merged with Renesas Technology Corporation, and Renesas Electronics Corporation took over all the business of both companies. Therefore, although the old company name remains in this document, it is a valid Renesas Electronics document. We appreciate your understanding.

Renesas Electronics website: http://www.renesas.com

April ${ }^{\text {st }}, 2010$<br>Renesas Electronics Corporation

Issued by: Renesas Electronics Corporation (http://www.renesas.com)
Send any inquiries to http://www.renesas.com/inquiry.

## Notice

1. All information included in this document is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas Electronics products listed herein, please confirm the latest product information with a Renesas Electronics sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas Electronics such as that disclosed through our website.
2. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
3. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part.
4. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
5. When exporting the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations. You should not use Renesas Electronics products or the technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations.
6. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
7. Renesas Electronics products are classified according to the following three quality grades: "Standard", "High Quality", and "Specific". The recommended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below. You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application categorized as "Specific" without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application for which it is not intended without the prior written consent of Renesas Electronics. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for an application categorized as "Specific" or for which the product is not intended where you have failed to obtain the prior written consent of Renesas Electronics. The quality grade of each Renesas Electronics product is "Standard" unless otherwise expressly specified in a Renesas Electronics data sheets or data books, etc.
"Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots.
"High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anticrime systems; safety equipment; and medical equipment not specifically designed for life support.
"Specific": Aircraft; aerospace equipment; submersible repeaters; nuclear reactor control systems; medical equipment or systems for life support (e.g. artificial life support devices or systems), surgical implantations, or healthcare intervention (e.g. excision, etc.), and any other applications or purposes that pose a direct threat to human life.
8. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.
(Note 1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its majorityowned subsidiaries.
(Note 2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.

## SERIAL CONTROL 7-CHANNEL H-BRIDGE DRIVER

## DESCRIPTION

The $\mu$ PD168113 is a serial control 7-channel H-bridge driver that consists of a CMOS controller and a MOS output stage. It can reduce the current consumption and the voltage loss at the output stage compared with a conventional driver using bipolar transistors, thanks to employment of a MOS process. The $\mu$ PD168113 can drive various motor coils by controlling the serial, so that the number of signal lines necessary for controlling the motor can be decreased.

The package is a 56-pin WQFN that helps reduce the mounting area and height.
The $\mu$ PD168113 can be used to drive two stepping motors, or two DC motors and one coil.

## FEATURES

- Seven H-bridge circuits employing power MOS FET
- Low-voltage driving

VDD $=2.7$ to 3.6 V
$\mathrm{V}_{\mathrm{M}}=2.7$ to 5.5 V

- Output on-state resistance: $1.0 \Omega$ TYP., $1.5 \Omega$ MAX. (sum of top and bottom stage)
- Output current
$<1$ ch to 6 ch>
DC current: $0.4 \mathrm{~A} / \mathrm{ch}$ (when each channel is used independently)
Peak current: $0.7 \mathrm{~A} / \mathrm{ch}$ (when each channel is used independently)
$<7$ ch>
DC current: $0.5 \mathrm{~A} / \mathrm{ch}$ (when used independently)
Peak current: $0.7 \mathrm{~A} / \mathrm{ch}$ (when used independently)
- Input logic frequency: 6 MHz supported
- Undervoltage lockout circuit

Shuts down the internal circuit at $\mathrm{V} D \mathrm{D}=1.7 \mathrm{~V}$ TYP.

- Overheat protection circuit

Operates at $150^{\circ} \mathrm{C}$ or more and shuts down internal circuitry.

- 56-pin WQFN ( $\square 8 \mathrm{~mm}, 0.5 \mathrm{~mm}$ pitch)

## ORDERING INFORMATION

Part Number
$\mu$ PD168113K9-9B4-A

## Package

56-pin plastic WQFN ( $8 \times 8$ )

## 1. PIN CONFIGURATION

Package: 56-pin plastic WQFN (8x8)

## 2. PIN FUNCTIONS

| Pin No. | Pin Name | Function |
| :---: | :---: | :---: |
| 39 | $\mathrm{OUT}_{3 \mathrm{~A}}$ | H-bridge 3 output pin A |
| 40 | V M | H-bridge 3, H-bridge 4 power supply pin |
| 41 | $\mathrm{OUT}_{3 \mathrm{~B}}$ | H-bridge 3 output pin B |
| 42 | FB3 | Current detection resistor connection pin 3 |
| 43 | TEST | Test input pin (Connect to GND when normal using.) |
| 44 | ( NC ) | Unused |
| 45 | $\mathrm{FB}_{7}$ | Current detection resistor connection pin 7 |
| 46 | $\mathrm{PGND}_{7}$ | H-bridge 7 GND pin |
| 47 | OUT ${ }_{\text {7A }}$ | H-bridge 7 output pin A |
| 48 | $\mathrm{V}_{\mathrm{M} 7}$ | H-bridge 7 power supply pin |
| 49 | OUT ${ }_{\text {78 }}$ | H-bridge 7 output pin B |
| 50 | $\mathrm{PGND}_{7}$ | H-bridge 7 GND pin |
| 51 | CLKB | External clock output pin/crystal oscillator connection pin 2 |
| 52 | CLK | External clock output pin/crystal oscillator connection pin 1 |
| 53 | cosc | Chopping frequency setting capacitor connection pin |
| 54 | VDD | Logic block power supply pin |
| 55 | $1 \mathrm{~N}_{78}$ | H -bridge 7 input pin B |
| 56 | $\mathrm{IN}_{7 \text { A }}$ | H-bridge 7 input pin A |

## 3. BLOCK DIAGRAM

Cautions 1. Be sure to connect all of the pins which have more than one.
 pins.
Fix these input pins to GND when they are not used.

## 4. STANDARD CONNECTION EXAMPLES

(1) For external control of only ch7 when external CLK is input and two stepping motors are used

(2) For external control of ch5 to ch7 when crystal oscillator and one stepping motor are used

## 5. FUNCTIONAL DEPLOYMENT

### 5.1 Serial Control

All information for driving the motor is processed by serial data from the CPU. The following parameters can be set by commands.

- Control of DC motor driving and output duty
- Control during constant-current driving and current setting
- Wait value for setting timing during stepping motor driving
- Motor current, motor revolution direction, and output excitation mode
- Pulse cycle, and number of pulses

Each command is assigned an address. Each data can be updated by inputting 16-bit data. For the configuration of the data and details of commands, refer to 9. SERIAL INTERFACE SPECIFICATIONS.

### 5.2 Reset Function

An initialization operation is performed and all the internal data is cleared to 0 when RESETB $=\mathrm{L}$. The output remains in the $\mathrm{Hi}-\mathrm{Z}$ state.

When RESETB = H, commands can be input.
Once it sets the address 0 to address 2 for an initialization setting, they carry out latch operation inside, and prohibit overwriting. In order that initialization operation is performed again, the reset operation is needed.
Be sure to perform a reset operation after turning on power supply. When RESETB $=L$, the internal circuitry is stopped whenever possible, so that the self current consumption can be reduced. When input of the external CLK is stopped, the current consumption can be lowered to $1 \mu \mathrm{~A}$ MAX.
Immediately after release of reset, excitation is started from the position where the current of ch1 is $100 \%$ and the current of ch2 is $0 \%$, in the micro step drive mode and 1-2 phase excitation drive mode. In the 2 -phase excitation drive mode, excitation is started from the position where the currents of ch1 and ch2 are $100 \%$.

Remark L: Low level, H: High level, Hi-Z: High impedance

### 5.3 Current Detection Resistor Connection (FB) Pin

The current detection resistor is connected when current driving is necessary.
For example: When micro step driving, when solenoid driving.

The current that flows into the output is \{set voltage value/FB pin resistance $\times 1000\}$.

$$
\text { Example) } \begin{aligned}
& \text { Where the set voltage value is } 200 \mathrm{mV}, \mathrm{FB}=2 \mathrm{k} \Omega \\
& \text { Output current value }=200(\mathrm{mV}) / 2(\mathrm{k} \Omega) \times 1000 \\
&=100(\mathrm{~mA})
\end{aligned}
$$

Therefore, the load is driven at a constant current of 100 mA .

The set voltage value is a value that can be set by serial control.

### 5.4 Undervoltage Lockout (UVLO) Circuit

This function is to forcibly stop the operation of the IC to prevent malfunctioning if VDD drops.
If $V_{D D}$ drops abruptly in the order of several $\mu \mathrm{s}$, this function may not operate.

### 5.5 Overheat Protection (TSD) Circuit

This function is to forcibly stop the operation of the IC to protect it from destruction due to overheating if the chip temperature of the IC rises.

The overheat protection circuit operates when the chip temperature rises to $150^{\circ} \mathrm{C}$ or more. When overheat is detected, all the circuits are stopped. When reset is performed or when UVLO is detected, the overheat protection circuit does not operate.

### 5.6 Power Up Sequence

This IC has a circuit that prevents current from flowing into the $\mathrm{V}_{\mathrm{m}}$ pin when $\mathrm{VDD}=0 \mathrm{~V}$. Therefore, the current that flows into the $\mathrm{Vm}_{\mathrm{m}}$ pin is cut off when $\mathrm{V}_{\mathrm{dD}}=0 \mathrm{~V}$.
Because the $V_{D D}$ pin voltage and $V_{M}$ pin voltage are monitored, a current of $3 \mu \mathrm{~A} M A X$. flows into the $V_{M}$ pin when VDD is applied.

## 6. COMMAND INPUT TIMING CHART

This IC can drive a stepping motor, DC motor, and solenoid by serial control if serial control is set during initialization. If direct input is set, this IC can drive the load by an input/output PWM control method.

With the serial control setting, two or more motors can be simultaneously controlled by commands.
Be sure to execute initialization (addresses 0 to 2 ) immediately after power application and immediately after reset.
After initialization, the motors can be controlled simply by inputting driving data (addresses 3 to F ).
To execute initialization again from the start, the RESET pin must be made high and data of addresses 0 to 2 must be input.

### 6.1 Setting Examples

### 6.1.1 Stepping motor

Starts output after wait time synchronized with LATCH has fallen.

### 6.1.2 DC motor/coil

Starts output after LATCH has fallen.

### 6.2 Example of Address Setting

## 7. SERIAL DATA INPUT SEQUENCE

The $\mu$ PD168113 can control driving of two or more motors with only a few CPU signals by using a serial data input method. The serial data is input as follows.
(1) Input addresses 0 to 2 after power up and initialization.
(2) Depending on the type of the motor set, input the necessary data of addresses 3 to $F$ (two or more addresses may be input).
(3) When performing the driving setting, only the necessary data of addresses 3 to $F$ has to be input because the previous data is retained.
Only the output related to the input address will change.
To perform an initialization operation such as selecting the motor, initialize the internal registers by using the RESETB pin.

Figure 7-1. Operation Sequence When Serial Data Is Input

## 8. NOTES ON TRANSMITTING DATA

- The first input data is loaded when SCLK changes from $L$ to $H$ after LATCH has changed from $L$ to $H$.

Data is transmitted in 16-bit units, and is determined when LATCH changes from H to L . Invalid data of less than 16-bit is discarded.

- Data of different addresses can be input successively while LATCH $=\mathrm{H}$.
- The access time can be shortened by updating only the necessary data after initialization has been performed.

If an address is not input, the previous value of that address is held as the data.

Examples) DC motor and constant current: The ON/OFF state is held.
Stepping motor: The excitation position is held if the excitation state is in ON.

- If the same address is input more than one while LATCH $=\mathrm{H}$, the last input data is valid.
- If invalid data and correct data are input while LATCH $=\mathrm{H}$, only the correct data is valid.
- If only LATCH is input, the data is not updated, and the driver holds the current status.
- If a command related to stepping motors (addresses 8 to $F$ ) is input during the "wait period" that lasts from input of the preceding data to the start of counting, the data is ignored. A command related to the DC motor and coil (addresses 3 to 7 ) is valid during the synchronization period.
- Data that is input when RESETB $=\mathrm{L}$ is ignored.

## 9. SERIAL INTERFACE SPECIFICATIONS

The internal data is determined by inputting 16-bit serial data SDATA synchronized with serial clock SCLK, and making LATCH $=\mathrm{L}$. Serial data is input from the LSB (D0) to the MSB (Df).

SDATA: When LATCH = H, data is loaded to the internal circuitry at the rising edge of SCLK, and latch operation performed a the falling of SCLK
LATCH: Inputting SDATA is prohibited when LATCH is L. Inputting SDATA is enabled when it is H. The internal data is determined when LATCH changes from H to L .

Because this IC generates the internal timing via the external CLK (OSCIN) its set values depend upon the frequency of CLK.
An example where CLK $=5 \mathrm{MHz}$ is given below. To input a frequency other than 5 MHz to CLK, use the following expression. Items related to the serial register are marked $\mathfrak{\sim}$.

Time: Set value $=$ Setting example $\times(5 / C L K[M H z])$
Frequency: Set value $=$ Setting example $x(C L K[M H z] / 5)$

## <Data configuration>

16-bit data consists of address: 4-bit and data: 12-bit.
Four bits (Dc, Dd, De and Df) are used to set an address. Sixteen types of addresses 0 to F can be used.
Twelve bits ( DO to Db ) are used to set data.

| Bit | Df | De | Dd | Dc | Db | Da | D9 | D8 | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |
| :---: | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Data | Address |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

Examples) $\quad$ Address 1: (Df, De, Dd, Dc$)=(0,0,0,1)$
Address A: (Df, De, Dd, Dc) $=(1,0,1,0)$

For how to set data, refer to Table 10-1. to Table 10-4. Serial Register List, and 11. SERIAL COMMAND DETAILS.
The following chart shows an example of serial command waveforms.

## 10. ADDRESS LIST

| Address | Address Data |  |  |  | Item to Be Set |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Df | De | Dd | Dc |  |
| Address 0 | 0 | 0 | 0 | 0 | Input mode selection, motor selection, wait setting |
| Address 1 | 0 | 0 | 0 | 1 | Chopping frequency setting, MOB output selection |
| Address 2 | 0 | 0 | 1 | 0 | Test function |
| Address 3 | 0 | 0 | 1 | 1 | Constant current ch3 |
| Address 4 | 0 | 1 | 0 | 0 | Constant current ch4 |
| Address 5 | 0 | 1 | 0 | 1 | DC motor ch5 |
| Address 6 | 0 | 1 | 1 | 0 | DC motor ch6 |
| Address 7 | 0 | 1 | 1 | 1 | Constant current ch7 |
| Address 8 | 1 | 0 | 0 | 0 | Motor driving initialization setting, motor current setting |
| Address 9 | 1 | 0 | 0 | 1 | Acceleration/deceleration parameter setting, plus number multiplication factor setting |
| Address A | 1 | 0 | 1 | 0 | Pulse cycle setting |
| Address B | 1 | 0 | 1 | 1 | Number of pulses setting |
| Address C | 1 | 1 | 0 | 0 | Motor driving initialization setting, motor current setting |
| Address D | 1 | 1 | 0 | 1 | Acceleration/deceleration parameter setting, plus number multiplication factor setting |
| Address E | 1 | 1 | 1 | 0 | Pulse cycle setting |
| Address F | 1 | 1 | 1 | 1 | Number of pulses setting |

## 11. SERIAL COMMAND DETAILS

### 11.1 Address 0

| Bit | Df | De | Dd | Dc | Db | Da | D9 | D8 | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |
| :---: | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Data | 0 | 0 | 0 | 0 | 0 | 0 | Note 4 | Note 3 | Note 2 | Note 1 | Wait setting |  |  |  |  |  |

Notes 1. ch3, ch4 driving motor setting
2. ch5 serial/direct input mode selection
3. ch6 serial/direct input mode selection
4. ch7 serial/direct input mode selection

## $\approx$ 11.1.1 Wait value

When the stepping motor is to be controlled, counting is started from the falling of the LATCH signal and the motor is excited when the count value reaches 0 . Even if transmission of serial data is delayed by the wait value, the stepping motor can be driven at a predetermined timing if the LATCH signal is periodically input.
Note that the wait value must not be set to 0 . The wait time can be set in a range of 64 to $2048 \mu$ s with a resolution of $32 \mu \mathrm{~s}$ using data.

### 11.1.2 Example of setting wait value

| D5....D0 | Set Value $(\mu \mathrm{s})$ |
| :---: | :---: |
| 000000 | Input prohibited |
| 000001 | 64 |
| 000010 | 96 |
| $:$ | $:$ |
| 111101 | 1984 |
| 111110 | 2016 |
| 111111 | 2048 |

### 11.1.3 Definition by wait value

### 11.1.4 ch3, ch4 driving motor setting

D6 = 0: Stepping motor driving
D6 = 1: Constant-current driving mode that can be set only by serial mode.

When D6 = 0, ch3 and ch4 have functions equivalent to ch1 and ch2, and can be used to drive a stepping motor.
When D6 = 1, ch3 and ch4 are independently used for constant-current driving. However, because ch3 and ch4 internally share the same driving power supply, these channels must be supplied from the same source.

### 11.1.5 ch5 to ch7 serial/direct input mode selection

## <ch5 serial/direct input mode selection>

D7 $=0$ : ch5 is a setting mode by serial mode
D7 = 1: ch5 is a setting mode by direct input mode
<ch6 serial/direct input mode selection>
$\mathrm{D} 8=0$ : ch6 is a setting mode by serial mode
D8 = 1: ch6 is a setting mode by direct input mode
<ch7 serial/direct input mode selection>
D9 $=0$ : ch7 is a setting mode by serial mode
D9 = 1 : ch7 is a setting mode by direct input mode

If each or all of ch5 to ch7 is setting mode by direct input mode, refer to 13. FUNCTION OPERATION TABLE.

### 11.2 Address 1

This address is used to set a chopping frequency that is the reference of PWM output.

| Bit | Df | De | Dd | Dc | Db | Da | D9 | D8 | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |
| :---: | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Data | 0 | 0 | 0 | 1 | 0 | 0 | 0 | Note 3 | Note 2 2 | Note 1 | Chopping frequency |  |  |  |  |  |

Notes 1. Pulse output function selection when EXT output
2. MOB output selection setting
3. MOB output position setting

### 11.2.1 Chopping frequency

A chopping mode is employed for the output to drive the motor on a constant current.
The chopping frequency that is the reference of the output can be changed with data, so that the PWM output does not interfere with the other signals.
The chopping frequency can be set in a range of 40 to 250 kHz by the data of D0 to D5.
The set chopping frequency is used for output when executing stepping motor and constant-current driving.

## <Output in accordance with set chopping frequency>

- For constant-current driving with stepping motor (ch1 to ch4)
- For constant-current driving (ch3, ch4, ch7)

Refer to the following table for the set value.

| D5......D0 | Chopping Frequency (kHz) | D5......D0 | Chopping Frequency (kHz) | D5......D0 | Chopping Frequency (kHz) |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 000000 | 0 (no pulse output) | 011000 | 120 | 101100 | 225 |
| 000001 | 0 (no pulse output) | 011001 | 125 | 101101 |  |
| : | : | 011010 | 130 | 101110 |  |
| 000111 | 0 (no pulse output) | 011011 |  | 101111 |  |
| 001000 | 40 | 011100 | 140 | 110000 | 250 |
| 001001 | 45 | 011101 | 145 | 110001 |  |
| 001010 | 50 | 011110 |  | 110010 |  |
| 001011 | 55 | 011111 | 155 | 110011 |  |
| 001100 | 60 | 100000 |  | 110100 |  |
| 001101 | 65 | 100001 | 165 | 110101 |  |
| 001110 | 70 | 100010 |  | 110110 |  |
| 001111 | 75 | 100011 | 180 | 110111 |  |
| 010000 | 80 | 100100 |  | 111000 |  |
| 010001 | 85 | 100101 |  | 111001 |  |
| 010010 | 90 | 100110 | 190 | 111010 |  |
| 010011 | 95 | 100111 |  | 111011 |  |
| 010100 | 10 | 101000 |  | 111100 |  |
| 010101 | 105 | 101001 | 210 | 111101 |  |
| 010110 | 110 | 101010 |  | 111110 |  |
| 010111 | 115 | 101011 |  | 111111 |  |

### 11.2.2 Pulse output function selection when EXT output

If D 6 is set, the function which acts as the monitor of the output state of the driving pulse by the EXT pin can be selected.

When D6 = 0,
EXT 1 : Output pulse synchronization mode of the micro step output 1
EXT2: Output pulse synchronization mode of the micro step output 2

When D6 = 1,
$\mathrm{EXT}_{1}$ : Mode with output time of micro step output 1 fixed to H
$\mathrm{EXT}_{2}$ : Mode with output time of micro step output 2 fixed to H

The output synchronization mode is duty $50 \%$ TYP. in accordance with the pulse frequency setting.
To count the number of pulses, count the rising edges.

### 11.2.3 Restrictions in pulse output synchronization mode

(1) Output is not guaranteed if the pulse period is $2 \mu \mathrm{~s}$ (Db to D0: 000000000001).
(2) Output is equivalent to the H time during steady-state driving (equivalent to pulse period setting) while an acceleration/deceleration operation is performed.
(3) If the multiplication factor of the number of pulses is set to other than 1 , the set number of pulses (address $5 \times \mathrm{m}$ ) is output.

### 11.2.4 Restrictions in mode in which output time is fixed to $H$

The output falls in synchronization with the falling of the pulse that is to be output at the same timing in the pulse output synchronization mode.

When the last pulse is output, therefore, it rises earlier than the period of the pulse cycle ( $50 \%$ of pulse cycle or less)

### 11.2.5 MOB output selection setting (only when micro step driving)

The output function of MOB can be selected by D7. It becomes effective only when the micro step driving mode selected.
$D 7=0: M O B$ is output once per cycle.
$D 7=1:$ MOB is output four times per cycle.
For the output position of MOB, refer to 11.2.6 MOB output position setting (set by D8).

| D7 | MOB Output |
| :---: | :---: |
| 0 | 1 pulse/cycle |
| 1 | 4 pulses/cycle |

11.2.6 MOB output position setting (when micro step driving or 1-2 phase excitation driving)

The MOB output timing position can be selected by D8. It becomes effective when the micro step driving mode or the 1-2 phase excitation driving mode selected.
$\mathrm{D} 8=0: \mathrm{MOB}$ is output at the one-phase excitation position (where the current of ch1 or ch2 is $100 \%$ ).
$D 8=1: M O B$ is output at the two-phase excitation position (where the currents of ch1 and ch2 are the same).
Selection of MOB output (D7) is made in accordance with the setting of D8.
When $\mathrm{D} 8=1$, no signal is output from the MOB pin immediately after reset. In addition, MOB1 and MOB2 cannot be set individually.

| D8 | MOB Output Position |
| :---: | :---: |
| 0 | one-phase excitation position |
| 1 | two-phase excitation position |

### 11.2.7 MOB output timing chart

Figure 11-1. MOB Output Timing Chart When Micro Step Driving

### 11.3 Address 2

This address is used as the test function for internal of the IC.

| Bit | Df | De | Dd | Dc | Db | Da | D9 | D8 | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |
| :---: | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Data | 0 | 0 | 1 | 0 |  | (Test function) |  |  |  |  |  |  |  |  |  |  |

## <Test function>

The test function is used to check the internal operations of the IC. Be sure to input the data of D0 to Db when usually using.

### 11.4 Address 3, Address 4 and Address 7

These addresses set constant-current driving.

Address 3

| Bit | Df | De | Dd | Dc | Db | Da | D9 | D8 | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |
| :---: | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

| Data | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | ch4 output current value setting | 0 | Note 2 | Note 1 |  |  |  |  |

Address 7

| Bit | Df | De | Dd | Dc | Db | Da | D9 | D8 | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |
| :---: | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Data | 0 | 1 | 1 | 1 | 0 | 0 | 0 | 0 | ch7 output current value setting |  |  |  |  |  | 0 | Note 2 |
| Note 1 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

Notes 1. Excitation ON/OFF
2. Excitation direction

### 11.4.1 Excitation ON/OFF

D0 selects whether the coil is to be driven.
D0 = 0: The output goes into a Hi-Z state.
$\mathrm{D} 0=1$ : The output is turned ON , and the coil is driven in accordance with the revolution direction and the output current value setting.

| D0 | Driving Mode |
| :---: | :---: |
| 0 | Hi-Z |
| 1 | Output ON |

### 11.4.2 Excitation direction

D1 selects the direction in which the coil is to be excited.
In the forward direction, the current flows from phase A to B. In the reverse direction, the current flows from phase B to A .

| D1 | Operation Mode |
| :---: | :---: |
| 0 | Current direction $\mathrm{A} \rightarrow \mathrm{B}$ (forward direction) |
| 1 | Current direction $\mathrm{B} \rightarrow \mathrm{A}$ (reverse direction) |

### 11.4.3 Output current value setting

Data of D3 to D7 sets the current value for constant-current control. These bits select the internal voltage that serves as a reference with a resolution of 20 mV . The current that flows to the output is $\{$ set voltage value/FB $\times 1000$ \} .

A voltage lower than 100 mV is fixed to 100 mV , and a voltage exceeding 500 mV is fixed to 500 mV . Therefore, the reference voltage can be set in a range of 100 to 500 mV . The operation frequency of the output is the frequency oscillation by the oscillator connected to COSC (100 kHz TYP.).

Example)
The set output current is calculated as follows where FB $=2 \mathrm{k} \Omega$ for constant-current driving at 100 mA .
Set voltage value $=100(\mathrm{~mA}) \times 2(\mathrm{k} \Omega) / 1000=200(\mathrm{mV}) \rightarrow(\mathrm{D} 7 \ldots . . . \mathrm{D} 3)=(01010)$

| D7......D3 | Reference Voltage (mV) | D7......D3 | Reference Voltage (mV) |
| :---: | :---: | :---: | :---: |
| 00000 | 100 | 10110 | 440 |
| 00001 | 100 | 10111 | 460 |
| $:$ | $:$ | 11000 | 480 |
| 00101 | 100 | 11001 | 500 |
| 00110 | 120 | $:$ | $:$ |
| 00111 | 140 | 11110 | 500 |
| $:$ | $:$ | 11111 | 500 |

### 11.5 Address 5 and Address 6

These addresses specify how a DC motor is to be driven.

Address 5

| Bit | Df | De | Dd | Dc | Db | Da | D9 | D8 | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |
| :---: | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Data | 0 | 1 | 0 | 1 | 0 | 0 | 0 | 0 | ch5 output duty setting |  | Note 3 | Note 2 | Note 1 |  |  |  |

Address 6

| Bit | Df | De | Dd | Dc | Db | Da | D9 | D8 | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |
| :---: | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Data | 0 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | ch6 output duty setting |  | Note 3 | Note 2 | Note 1 |  |  |  |

Notes 1. Motor ON/OFF
2. Revolution direction
3. Brake mode

### 11.5.1 Motor ON/OFF

D0 specifies whether the motor is to be driven.
$\mathrm{DO}=0$ : The motor is stopped (stop mode) .
The output status in the stop mode is $\mathrm{Hi}-\mathrm{Z}$ or short brake mode, depending on the value of D 2 , which selects a brake mode.
$D 0=1$ : The start mode is selected, and the motor is driven in accordance with the revolution direction and the output duty setting.

| D0 | Driving Mode |
| :---: | :---: |
| 0 | Stop mode |
| 1 | Start mode |

### 11.5.2 Revolution direction

D1 selects the revolution direction of the motor.
In the forward direction, the current flows from phase $A$ to $B$. In the reverse direction, the current flows from phase $B$
to A .

| D 1 | Operation Mode |
| :---: | :---: |
| 0 | Current direction $\mathrm{A} \rightarrow \mathrm{B}$ (forward direction) |
| 1 | Current direction $\mathrm{B} \rightarrow \mathrm{A}$ (reverse direction) |

### 11.5.3 Brake mode

D2 is used to select the output status in the stop mode.
D2 $=0$ : The output goes into a $\mathrm{Hi}-\mathrm{Z}$ state.
$D 2=1$ : The high side of both phase $A$ and $B$ is $O N$, and the short brake status is selected. At this time, the output goes H .

| D2 | Operation Mode |
| :---: | :---: |
| 0 | Hi-Z |
| 1 | Short brake (both phases A and B output H) |

## \& 11.5.4 Output duty setting

The output duty for current control is selected, and can be selected in 32 steps by data of D3 to D7.
The operation frequency of the output is set by counting the external CLK.

Operation frequency $=1 /(200 \mathrm{~ns} \times 32)=156.25 \mathrm{kHz}($ at 5 MHz$)$

| D7.....D3 | Output Duty (\%) | D7.....D3 | Output Duty (\%) |
| :---: | :---: | :---: | :---: |
| 00000 | 100 | 10000 | 50 |
| 00001 | 3.125 | 10001 | 53.125 |
| 00010 | 6.25 | 10010 | 56.25 |
| 00011 | 9.375 | $:$ | $:$ |
| $:$ | $:$ | 11110 | 93.75 |
| 01111 | 46.875 | 11111 | 96.875 |

Caution When all of D3 to D7 is 0 , the output duty is $100 \%$. Be sure to use the stop mode when the output duty is $0 \%$.

### 11.6 Address 8

This address selects basic-operation setting of stepping motor (the maximum current value, the revolution direction of the motor and the operation mode).

| Bit | Df | De | Dd | Dc | Db | Da | D9 | D8 | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |
| :---: | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Data | 1 | 0 | 0 | 0 | 0 | Note 6 | Note 5 | Note 4 | Note 3 | Note 2 | Note 1 | Output current setting |  |  |  |  |

Notes 1. Motor revolution direction
2. Stop mode
3. Output enable setting
4. Driving mode selection 0
5. Driving mode selection 1
6. Constant-current changing when two-phase excitation driving or 1-2 phase excitation driving

### 11.6.1 Output current setting

An internal reference voltage value (EVRMAX) for constant-current driving is set. The internal reference voltage is specified by data of D0 to D4 at a resolution of 20 mV . Micro step driving can be performed with the set reference voltage as the maximum value. The peak value of the drive current is EVRMAX (V)/FB $(\Omega) \times 1000$.

Set value: EVRMAX = (D4......D0) $\times 20 \mathrm{mV}$
However, $100 \mathrm{mV} \leq$ EVRMAX $\leq 500 \mathrm{mV}$

| D4.....D0 | Reference Voltage $(\mathrm{mV})$ | D4......D0 | Reference Voltage (mV) |
| :---: | :---: | :---: | :---: |
| 00000 | 100 | 10110 | 440 |
| 00001 | 100 | 10111 | 460 |
| $:$ | $:$ | 11000 | 480 |
| 00101 | 100 | 11001 | 500 |
| 00110 | 120 | $:$ | $:$ |
| 00111 | 140 | 11110 | 500 |
| $:$ | $:$ | 11111 | 500 |

Remark If a voltage less than 100 mV is set, the reference voltage is fixed to 100 mV . If a voltage higher than 500 mV is set, it is fixed to 500 mV .

### 11.6.2 Motor revolution direction setting

D5 is used to specify the motor revolution direction.
In the CW mode, the current of ch2 (ch4 in the case of address C ) is output, $90^{\circ}$ degrees in phase behind the current of ch1 (ch3 in the case of address C).

In the CCW mode, the current of ch2 (ch4 in the case of address C ) is output, $90^{\circ}$ ahead in phase behind the current of ch1 (ch3 in the case of address C).

| D5 | Operation Mode |
| :---: | :---: |
| 0 | CW mode (forward revolution) |
| 1 | CCW mode (reverse revolution) |

### 11.6.3 Stop mode setting

When $\mathrm{D} 6=1$, the motor advances to the position of $\mathrm{MOB}_{1}$ output $=\mathrm{L}$, and the output status is held.
The set number of pulses is held even in the stop mode.
Because the motor is driven regardless of the set number of pulses, however, the position information of the motor must be taken into consideration when a command is set to resume driving.

| D6 | Operation Mode |
| :---: | :---: |
| 0 | Normal mode |
| 1 | Stop mode |

Caution Inputting data is prohibited while the stop mode is set ( $\mathrm{MOB}_{1}$ reaches L ). Do not update the data.
No pulse is output if the stop mode is set while $\mathrm{MOB}_{1}=L$
In addition, MOB2 is output in the case of address $\mathbf{C}$.

### 11.6.4 Output enable setting

D7 = 1: The motor can be driven. To drive the motor, be sure to set this bit to 1 .
D7 = 0: The output goes into a Hi-Z state, regardless of the other settings.
If $D 7$ is changed from 0 to 1 , the internal information is held and therefore the excitation position is recorded.
Therefore, excitation is started from the position where D7 is cleared to 0 .

| D7 | Operation Mode |
| :---: | :---: |
| 0 | Output Hi-Z |
| 1 | Enable mode |

### 11.6.5 Driving mode selection 0 and driving mode selection 1

D8 and D9 can be used to select driving mode of two-phase excitation, 1-2 phase excitation and micro step.
$\mathrm{D} 8=0$ : The micro step driving mode is selected.
$\mathrm{D} 8=1, \mathrm{D} 9=0$ : The two-phase excitation driving mode is selected.
$D 8=1, D 9=1$ : The 1-2 phase excitation driving mode is selected.
Immediately after rest, The micro step driving mode is selected.
When changing the driving mode from micro step to two-phase excitation or 1-2 phase excitation, note the following points.

## <lf the number of pulses is set to 0 >

The stop position when the constant current is changed may differ depending on Da , which selects a constant current in the two-phase or 1-2 phase excitation mode.

When $\mathrm{Da}=0$, the execution jumps to the two-phase or 1-2 phase position on the quadrant at the excitation position after completion of wait, and the motor is excited at a duty factor of $100 \%$. When $\mathrm{Da}=1$, the stop position is excited and held.
<lf pulse output is started by command setting to set a number of pulses of 1 or more> At the first pulse, the operation skips to the two-phase excitation position or the1-2 phase excitation position of the next quadrant and driving is started.
If the two-phase excitation driving mode is changed while the motor is stopped at the one-phase excitation position, it is judged that the position is included in the quadrant in the CW direction, and motor operates.

Refer to Figure11-3. Transition of Switching of Micro Step Driving $\leftarrow \rightarrow$ 1-2 Phase Excitation $\leftarrow \rightarrow$ 2-phase
Excitation (If Number of Pulses Is Set to 1 for Switching) for details.

| D8 | D9 | Operation Mode |
| :---: | :---: | :---: |
| 0 | 0 | Micro step driving |
| 0 | 1 |  |
| 1 | 0 | Two-phase excitation driving |
| 1 | 1 | $1-2$ phase excitation driving |

Figure 11-2. Concept of Changing Driving Mode from Micro Step to Two-phase Excitation

Figure 11-3. Transition of Switching of Micro Step Driving $\leftarrow \rightarrow$ 1-2 Phase Excitation $\leftarrow \rightarrow$ 2-phase Excitation (If Number of Pulses Is Set to 1 for Switching)

11.6.6 Constant-current changing when two-phase excitation/1-2 phase excitation

Da is used to select whether the motor is driven at an output duty of $100 \%$ (maximum torque operation) or under constant-current control when the two-phase excitation driving or the 1-2 phase excitation driving is selected.
When $\mathrm{Da}=0$, the motor is driven at an output duty of $100 \%$. It is excited in two-phase or 1-2 phase and driven at the maximum torque regardless of the current setting.

When $\mathrm{Da}=1$, the motor is excited in two-phase or $1-2$ phase at the motor current setting. The output current value is controlled to be the same value as the driving current at the phase $A=$ phase $B$ position (position of step $\theta 8$ ) in the micro step driving mode.

| Da | Operation Mode |
| :---: | :---: |
| 0 | Output duty $100 \%$ drive |
| 1 | Constant-current control drive |

Examples of the motor current waveform is shown 12. STEPPING MOTOR DRIVING WAVEFORM.

### 11.7 Address 9

This address is used to set parameters for acceleration/deceleration control, the pulse multiplication factor. By setting the parameters for acceleration/deceleration control, the pulse cycle can be gradually changed while the motor is accelerated or decelerated, so that step out of the motor can prevent.

By setting the pulse number multiplication factor to a value other than 1, the number of pulses can be extended in combination with the number of pulses set by address $B$. If the default value is not changed, the motor is driven without being accelerated or decelerated, and under the condition that the pulse number multiplication factor is 1 .

Notes 1. Selects whether deceleration is valid or invalid
2. Selects whether acceleration is valid or invalid

### 11.7.1 Pulse number multiplication factor

D1 and D0 are used to set the pulse number multiplication factor.
By setting a multiplication factor, if the number of motor pulses set at address $B$ is insufficient, the number of pulses can be extended maintaining 64 steps/cycle.

| D1 | D0 | Pulse Number Multiplication Factor m |
| :---: | :---: | :---: |
| 0 | 0 | $\mathrm{~m}=1$ |
| 0 | 1 |  |
| 1 | 0 | $\mathrm{~m}=2$ |
| 1 | 1 | $\mathrm{~m}=4$ |

### 11.7.2 For acceleration/deceleration control

Seven bits, D2 to D8, are used to set a driving profile for acceleration/deceleration.
The pulse rate vs. time draws an S-shaped curve. The shape of this S-curve can be changed according to the values set to D2 to D7.

The image of the operation during acceleration or deceleration is shown below.
94 pulses ${ }^{\text {Note }}$ each are necessary for acceleration and deceleration.
Usually, therefore, set 188 pulses ${ }^{\text {Note }}$ or more (acceleration pulses + deceleration pulses) to perform acceleration and deceleration. If the set number of pulses is less than $94^{\text {Note }}$ during acceleration or deceleration, refer to 11.7.10

## Example of acceleration/deceleration operation.

Note The number of pulses when startup time setting is one time is shown. If the startup time setting is two times and four times, the number of pulses is 188 pulses and 376 pulses. It is twice further the number of the pulses in acceleration/deceleration operation, and it is 376 pulses and 752 pulses.

### 11.7.3 Parameter for acceleration/deceleration control

Reference increment = pulse cycle (address A)/reference increment setting
Pulse cycle of each step = pulse cycle (address A) + reference increment x pulse cycle increment table
Time of each step $=$ pulse cycle of each step $x$ selected data table (number of pulses)

Table 11-1. Selected Data Table List

| Table | STEP <br> 1 | $\begin{gathered} \text { STEP } \\ 2 \\ \hline \end{gathered}$ | $\begin{gathered} \text { STEP } \\ 3 \\ \hline \end{gathered}$ | $\begin{gathered} \text { STEP } \\ 4 \\ \hline \end{gathered}$ | $\begin{gathered} \text { STEP } \\ 5 \end{gathered}$ | $\begin{gathered} \text { STEP } \\ 6 \\ \hline \end{gathered}$ | $\begin{gathered} \text { STEP } \\ 7 \\ \hline \end{gathered}$ | $\begin{gathered} \text { STEP } \\ 8 \\ \hline \end{gathered}$ | $\begin{gathered} \text { STEP } \\ 9 \end{gathered}$ | $\begin{gathered} \text { STEP } \\ 10 \end{gathered}$ | $\begin{gathered} \text { STEP } \\ 11 \\ \hline \end{gathered}$ | $\begin{array}{r} \text { STEP } \\ 12 \\ \hline \end{array}$ | $\begin{array}{r} \text { STEP } \\ 13 \\ \hline \end{array}$ | $\begin{gathered} \text { STEP } \\ 14 \\ \hline \end{gathered}$ | $\begin{gathered} \text { STEP } \\ 15 \end{gathered}$ |

| 3 | 1 | 3 | 3 | 4 | 3 | 4 | 3 | 3 | 3 | 3 | 5 | 9 | 13 | 15 | 22 |

Total: 94 pulses

Table 11-2. Pulse Cycle Increment Table List

| STEP | STEP |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 2 | STEP | STEP | STEP | STEP | STEP | STEP | STEP | STEP | STEP | STEP | STEP | STEP | STEP |
|  | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 |  |  |  |  |
| 120 | 56 | 35 | 24 | 18 | 13 | 10 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 |

Example) Driving time at each step in case of table 1

| STEP 1 | (Pulse cycle + reference increment x 120) | $x 2$ |
| :---: | :---: | :---: |
| STEP 2 | (Pulse cycle + reference increment x 56) | $\times 5$ |
| STEP 3 | (Pulse cycle + reference increment $\times 35$ ) | $\times 2$ |
| STEP 4 | (Pulse cycle + reference increment $\times 24$ ) | x 1 |
| STEP 5 | (Pulse cycle + reference increment $\times 18$ ) | x 1 |
| STEP 6 | (Pulse cycle + reference increment x 13) | x 1 |
| STEP 7 | (Pulse cycle + reference increment $\times 10$ ) | x 1 |
| STEP 8 | (Pulse cycle + reference increment $x$ 8) | x 1 |
| STEP 9 | (Pulse cycle + reference increment $\times 7$ ) | $\times 1$ |
| STEP 10 | (Pulse cycle + reference increment $\times 6$ ) | $\times 1$ |
| STEP 11 | (Pulse cycle + reference increment $\times 5$ ) | $x 2$ |
| STEP 12 | (Pulse cycle + reference increment $x 4$ ) | $\times 3$ |
| STEP13 | (Pulse cycle + reference increment $\times 3$ ) | x 11 |
| STEP 14 | (Pulse cycle + reference increment x 2 ) | $\times 31$ |
| STEP 15 | (Pulse cycle + reference increment x 1 ) | $\times 31$ |

Remark The number of an end indicates the number of pulses in the case of table 1. To use table 2 or table 3, refer to Table 11-1. Selected Data Table List

Acceleration time $=$ deceleration time $=$ sum of STEP 1 to STEP 15

### 11.7.4 Reference increment setting

D2 to D4 are sued to set a parameter that determines the pulse cycle at each step.
The reference increment is the pulse frequency set by address $A$ that is divided by the reference increment setting.
So that the speed changes draw a typical S-shape curve, it is recommended to set a value of 8 ( (D4, D3, D2) $=(1$, $0,0)$ ).

Reference increment = pulse cycle (address A)/reference increment setting

| D4 | D3 | D2 | Reference Increment Setting |
| :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 2 |
| 0 | 0 | 1 |  |
| 0 | 1 | 0 |  |
| 0 | 1 | 1 | 4 |
| 1 | 0 | 0 | 8 |
| 1 | 0 | 1 | 16 |
| 1 | 1 | 0 | 3 |
| 1 | 1 | 1 |  |

### 11.7.5 Table selection

This IC approximates the speed change curve during acceleration/deceleration operation to the shape S .
The speed change curve can be changed by selecting an internal table.

Table 1: S curve with abrupt speed change
Table 2: S curve with gentle speed change
Table 3: S curve with linear speed change (equivalent to trapezoid waveform)

| D6 | D5 | Table Selection |
| :---: | :---: | :---: |
| 0 | 0 | Table 1 |
| 0 | 1 |  |
| 1 | 0 | Table 2 |
| 1 | 1 | Table 3 |

### 11.7.6 Start time setting

D7 and D8 are used to select the operation time multiplication factor during an acceleration/deceleration operation.
The number of pulses necessary for each step during acceleration/deceleration can be selected from $\times 1, \mathrm{x} 2$ and x
4. For the number of pulses at each step, refer to Table 11-1. Selected Data Table List.

| D8 | D7 | Startup Time Setting | Number of Pulses Necessary for <br> Acceleration or Deceleration |
| :---: | :---: | :---: | :---: |
| 0 | 0 | $\times 1$ | 94 |
| 0 | 1 |  | 188 |
| 1 | 0 | $\times 2$ | 376 |
| 1 | 1 | $x 4$ |  |

### 11.7.7 Selects whether acceleration is valid or invalid

An acceleration operation can be performed in accordance with the acceleration control setting. The acceleration function can be valid or invalid by Da.

### 11.7.8 Selects whether deceleration is valid or invalid

An deceleration operation can be performed in accordance with the deceleration control setting. The deceleration function can be valid or invalid by D9.

| Da | D9 | Operation Mode |  |
| :---: | :---: | :---: | :---: |
|  |  | Acceleration | Deceleration |
| 0 | 0 | Invalid | Invalid |
| 1 | 0 | Valid | Invalid |
| 0 | 1 | Invalid | Valid |
| 1 | Valid | Valid |  |

### 11.7.9 Example of recommended setting

The following values are recommended for the parameters for acceleration and deceleration.
Note, however, that the characteristics differ depending on the motor to be used. Be sure to evaluate and confirm the values with the motor to be actually used, and set the parameters correctly.

Reference increment setting: 8 ( (D4, D3, D2) $=(1,0,0)$ )
Table selection: Table $1((D 6, D 5)=(0,0)$ )
Start time setting: x $1((\mathrm{D} 8, \mathrm{D} 7)=(0,0))$
Acceleration/deceleration valid/invalid: Acceleration/deceleration valid $((\operatorname{Da}, \mathrm{D} 9)=(1,1))$

### 11.7.10 Example of acceleration/deceleration operation

(1) Acceleration valid/deceleration valid

(2) Acceleration valid/deceleration invalid

(3) Acceleration invalid/deceleration invalid

(4) Acceleration invalid/deceleration valid

(1') Acceleration valid/deceleration valid ${ }^{\text {Note1 }}$

Condition: Set pulses/2 < acceleration/deceleration pulses
(2') Acceleration valid/deceleration invalid Note2

Condition: Set pulses < acceleration/deceleration pulses
(4') Acceleration invalid/deceleration valid ${ }^{\text {Note3 }}$

The left side figures in upper figures show the ideal operation waveform. If the number of set pulses is less than the number of acceleration/deceleration control pulses, the operation as the right side figures in upper figures.

Notes 1. The deceleration operation is stared when $1 / 2$ of the set number of pulses has been reached during the acceleration operation. Therefore, acceleration and deceleration are always mirrored.
2. If the set number of pulses is less than the number of acceleration/deceleration control pulses during only the acceleration operation, the operation is stopped at the pulse rate in the middle of acceleration.
3. If the set number of pulses is less than the number of acceleration/deceleration control pulses during only the deceleration operation, the last pulse rate does not reach the target value. The set number of pulses is output in accordance with the deceleration pulse curve, and the operation is stopped.

### 11.8 Address A

This address is used to set the pulse cycle per step (64 steps/cycle) .

| 1011 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |$|$

## $\approx$ 11.8.1 Pulse cycle

Twelve bits, DO to Db, are used to set the pulse cycle per step.
The pulse cycle can be set in a range of 0 to $8190 \mu \mathrm{~s}$ at a resolution of $2.0 \mu \mathrm{~s}$.
If all of the twelve-bit is 0 , no pulse is output and the driving status is maintained.
The pulse period indicates the time per step regardless of the driving mode (micro step, 1-2 phase excitation, or 2phase excitation). Therefore, the number of revolutions of the motor differs depending on the driving mode, even if the number of pulses is the same.
11.8.2 Example of pulse cycle setting

| Db.....D0 | Set Value $(\mu \mathrm{s})$ |
| :---: | :---: |
| 000000000000 | 0 |
| 000000000001 | 2.0 |
| 000000000010 | 4.0 |
| $:$ | $:$ |
| 111111111101 | 8186 |
| 111111111110 | 8188 |
| 111111111111 | 8190 |

### 11.9 Address B

This address is used to set the number of pulses.
The actual number of pulses is set by the product to the pulse number multiplication factor and the number of pulses sets at address 9.

| 1011 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |$|$

### 11.9.1 Number of pulses

Set the number of pulses to drive the motor. D0 to Db can be set a pulse in a range of 0 to 4095 pulses.
If the pulse number multiplication factor is set to a value other than 1 at address 9 , the number of pulses set here is multiplied by the set multiplication factor ( m ).
The number of pulses is internally multiplied by $(\mathrm{m})$ and then counted. If it is set to output pulses to $\mathrm{EXT}_{1}\left(\mathrm{EXT}_{2}\right.$ in the case of address F ), the number of counts output is the set value itself ( 0 to $4095 \times \mathrm{m}$ ).
The number of pulses indicates the number of pulses per pulse period regardless of the driving mode (micro step, 12 phase excitation, or 2-phase excitation). Therefore, the number of revolutions of the motor differs depending on the driving mode, even if the number of pulses is the same.

### 11.9.2 Example of pulse cycle setting

| Db.....D0 | Set Value |
| :---: | :---: |
| 000000000000 | 0 |
| 000000000001 | m |
| 000000000010 | $2 \times \mathrm{m}$ |
| $:$ | $:$ |
| 111111111101 | $4093 \times \mathrm{m}$ |
| 111111111110 | $4094 \times \mathrm{m}$ |
| 111111111111 | $4095 \times \mathrm{m}$ |

Remark $m$ indicates the set value of the pulse number multiplication factor of address 9 . If the value of the twelve-bit, D 0 to Db , is 0 , no pulse is output and the driving state is maintained.

### 11.10 Address C to Address F

Addresses $C$ to $F$ are used for setting stepping motor 2 (ch3 and ch4). The settings of other than addresses Dc, Dd, De, and Df are identical to the contents of addresses 8 to B. For details, refer to 11.6 Address 8 to 11.9 Address B.

## Address C

| Bit | Df | De | Dd | Dc | Db | Da | D9 | D8 | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |
| :---: | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Data | 1 | 1 | 0 | 0 | 0 | Note 6 | Note 5 | Note 4 | Note 3 | Note 2 | Note 1 | Output current setting |  |  |  |  |

Notes 1. Motor revolution direction
2. Stop mode
3. Output enable setting
4. Driving mode selection 0
5. Driving mode selection 1
6. Constant-current changing when two-phase excitation driving or 1-2 phase excitation driving

## Address D

| Bit | Df | De | Dd | Dc | Db | Da | D9 | D8 | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |

## 12. STEPPING MOTOR DRIVING WAVEFORM

Figure 12-1. Two-phase Excitation Output Mode

Figure 12-2. 1-2 Phase Excitation Output Mode

Remarks 1. Solid line: Output duty $100 \%$ drive, Dotted line: Current control drive (The current is in accordance with the current setting.)
2. The horizontal axis of the above charts indicates the number of steps. The above charts show an example in the CW (forward) mode.
The current flowing into phases $A$ and $B$ is positive in the direction from OUT pin $A$ to OUT pin $B$, and negative in the direction from OUT pin $B$ to OUT pin $A$.

Figure 12-3. Micro Step Driving Mode

Remark The horizontal axis of the above charts indicates the number of steps. The above charts show an example in the CW (forward) mode.
The current flowing into phases $A$ and $B$ is positive in the direction from OUT pin $A$ to OUT pin $B$, and negative in the direction from OUT pin $B$ to OUT pin $A$.

## 13. FUNCTION OPERATION TABLE

The table below shows the input/output logic when ch5 to ch7 are set in the external control mode by initialization. With ch7, an H-bridge current can be controlled by an external resistor for constant-current driving (output chopping operation by PWM driving).
The external control mode is invalid immediately after reset and before an address is set.
Therefore, address setting is necessary even when the external control mode is used.

### 13.1 Serial Setting Contents of ch5 and ch6

Even when the external control mode is selected, the contents of the set output duty factor of ch5 (address 5) and ch6 (address 6) are reflected. As the output duty factor of the output stage, therefore, the logical product of an external control signal and the serial command setting is output. For the setting method by a command, refer to 11.5

## Address 5 and Address 6.

### 13.2 Setting of ch7

ch7 is used for constant-current driving with a resistor connected to the FB pin. The current that serves as a reference is set by a serial command. Therefore, set the current of ch7 (address 7) even when the external control mode is selected.
For the setting method by a command, refer to 11.4 Address 3, Address 4, and Address 7.

Figure 13-1. Truth Table of ch5 to ch7

| Input |  |  |  | Output |  |
| :---: | :---: | :---: | :---: | :---: | :---: |

Remark x: Don't care

## 14. ELECTRICAL SPECIFICATIONS

Absolute Maximum Ratings $\left(\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}\right.$, glass epoxy board of $100 \mathrm{~mm} \times 100 \mathrm{~mm} \times 1 \mathrm{~mm}$ with copper foil area of $15 \%$ )

| Parameter | Symbol | Condition | Rating | Unit |
| :---: | :---: | :---: | :---: | :---: |
| Power supply voltage | V DD | Control block | -0.5 to +6.0 | V |

| VDD pin current in during operation | $\operatorname{ldD}(\mathrm{ACT})$ | RESETB pin: High level |  |  | 5.0 | mA |
| High-level input current | IIH | $\mathrm{V}_{\mathrm{IN}}=\mathrm{V}_{\text {DD }}$ |  |  | 50 | $\mu \mathrm{A}$ |
| Low-level input current | IIL | $\mathrm{VIN}=0 \mathrm{~V}$ | -1.0 |  |  | $\mu \mathrm{A}$ |
| Input pull down resistance | Rind |  | 50 |  | 200 | $\mathrm{k} \Omega$ |
| High-level input voltage | $\mathrm{V}_{\mathrm{IH}}$ | $2.7 \mathrm{~V} \leq \mathrm{VDD} \leq 3.6 \mathrm{~V}$ | $0.7 \times \mathrm{V}_{\text {DD }}$ |  |  | V |
| Low-level input voltage | VIL | $2.7 \mathrm{~V} \leq \mathrm{VDD} \leq 3.6 \mathrm{~V}$ |  |  | $0.3 \times \mathrm{VDD}$ | V |
| H-bridge on-state resistance | Ron | $\mathrm{I}_{\mathrm{m}}=0.3 \mathrm{~A}$, sum of upper and lower stages |  | 1.0 | 1.5 | $\Omega$ |
| Output leakage current ${ }^{\text {Note } 1}$ | Im(off) | Per Vм pin, all control pins: Low level |  |  | 1.0 | $\mu \mathrm{A}$ |
| Low-voltage detection voltage | VDDS |  |  | 1.7 | 2.5 | V |
| Internal reference voltage ${ }^{\text {Note } 2}$ | Vref |  | 450 | 500 | 550 | mV |
| Current detection ratio (ch1 to ch4) Note 2 |  | $\mathrm{I}_{\mathrm{M}}=0.1 \mathrm{~A}$, with sense resistor (connect to FB) of $2 \mathrm{k} \Omega$ | 900 | 1000 | 1100 |  |
| Current detection ratio (ch7) ${ }^{\text {Note } 2}$ |  |  | 950 | 1050 | 1150 |  |
| Output turn-on time | ton | $\mathrm{RL}=20 \Omega$ | 0.02 | 0.5 | 1.0 | $\mu \mathrm{S}$ |
| Output turn-off time | toff |  | 0.02 | 0.5 | 1.0 | $\mu \mathrm{S}$ |
| EXT high-level output voltage | $\mathrm{V}_{\text {ext }}$ | $\mathrm{lo}=-100 \mu \mathrm{~A}$ | $0.9 \times \mathrm{VDD}$ |  |  | V |
| EXT low-level output voltage | $V_{\text {extL }}$ | $\mathrm{lo}=+100 \mu \mathrm{~A}$ |  |  | $0.1 \times \mathrm{VDD}$ | V |
| EVRMAX voltage | EVRMAX | $($ D0 to D 4$)=(1,1,1,1,1)^{\text {Note } 3}$ | 450 | 500 | 550 | mV |

Notes 1. This IC has a circuit that prevents current from flowing into the $\mathrm{V}_{\mathrm{m}}$ pin when $\mathrm{V}_{\mathrm{DD}}=0 \mathrm{~V}$.
2. The motor current accuracy varies depending on the motor actually used. With this IC, the total of the reference voltage Vref error and the current sense circuit error is within $\pm 10 \%$.
3. Current setting parameter for address 3 , address 4 , address 7 , address 8 and address C .

## 15. PACKAGE DRAWING

## 56-PIN PLASTIC WQFN (8x8)

## 16. RECOMMENDED SOLDERING CONDITIONS

The $\mu$ PD168113 should be soldered and mounted under the following recommended conditions.
For soldering methods and conditions other than those recommended below, contact an NEC Electronics sales representative.

For technical information, see the following website.

## Semiconductor Device Mount Manual (http://www.necel.com/pkg/en/mount/index.html)

## Type of Surface Mount Device

$\star \mu$ PD168113K9-9B4-A: 56-pin plastic WQFN (8 x 8)

| Process | Conditions | Symbol |
| :---: | :--- | :---: |
| Infrared reflow | Package peak temperature: $260^{\circ} \mathrm{C}$, Time: 60 seconds MAX. (at $220^{\circ} \mathrm{C}$ or higher), <br> Count: Three times or less, Exposure limit: 3 days, Flux: Rosin flux with low chlorine <br> $(0.2 \mathrm{Wt} \%$ or below) recommended | IR60-103-3 |
|  |  |  |

Caution Do not use different soldering methods together (except for partial heating).

## NOTES FOR CMOS DEVICES

## (1) VOLTAGE APPLICATION WAVEFORM AT INPUT PIN

Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between VIt (MAX) and $\mathrm{V}_{\mathrm{IH}}$ (MIN) due to noise, etc., the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between VIL (MAX) and $\mathrm{V}_{\mathrm{IH}}$ (MIN).

## (2) HANDLING OF UNUSED INPUT PINS

Unconnected CMOS device inputs can be cause of malfunction. If an input pin is unconnected, it is possible that an internal input level may be generated due to noise, etc., causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using pull-up or pull-down circuitry. Each unused pin should be connected to Vod or GND via a resistor if there is a possibility that it will be an output pin. All handling related to unused pins must be judged separately for each device and according to related specifications governing the device.

## (3) PRECAUTION AGAINST ESD

A strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it when it has occurred. Environmental control must be adequate. When it is dry, a humidifier should be used. It is recommended to avoid using insulators that easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors should be grounded. The operator should be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with mounted semiconductor devices.

## (4) STATUS BEFORE INITIALIZATION

Power-on does not necessarily define the initial status of a MOS device. Immediately after the power source is turned ON, devices with reset functions have not yet been initialized. Hence, power-on does not guarantee output pin levels, I/O settings or contents of registers. A device is not initialized until the reset signal is received. A reset operation must be executed immediately after power-on for devices with reset functions.

## Reference Documents

Quality Grades On NEC Semiconductor Devices (C11531E)

- The information in this document is current as of April, 2004. The information is subject to change without notice. For actual design-in, refer to the latest publications of NEC Electronics data sheets or data books, etc., for the most up-to-date specifications of NEC Electronics products. Not all products and/or types are available in every country. Please check with an NEC Electronics sales representative for availability and additional information.
- No part of this document may be copied or reproduced in any form or by any means without the prior written consent of NEC Electronics. NEC Electronics assumes no responsibility for any errors that may appear in this document.
- NEC Electronics does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from the use of NEC Electronics products listed in this document or any other liability arising from the use of such products. No license, express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC Electronics or others.
- Descriptions of circuits, software and other related information in this document are provided for illustrative purposes in semiconductor product operation and application examples. The incorporation of these circuits, software and information in the design of a customer's equipment shall be done under the full responsibility of the customer. NEC Electronics assumes no responsibility for any losses incurred by customers or third parties arising from the use of these circuits, software and information.
- While NEC Electronics endeavors to enhance the quality, reliability and safety of NEC Electronics products, customers agree and acknowledge that the possibility of defects thereof cannot be eliminated entirely. To minimize risks of damage to property or injury (including death) to persons arising from defects in NEC Electronics products, customers must incorporate sufficient safety measures in their design, such as redundancy, fire-containment and anti-failure features.
- NEC Electronics products are classified into the following three quality grades: "Standard", "Special" and "Specific".
The "Specific" quality grade applies only to NEC Electronics products developed based on a customerdesignated "quality assurance program" for a specific application. The recommended applications of an NEC Electronics product depend on its quality grade, as indicated below. Customers must check the quality grade of each NEC Electronics product before using it in a particular application.
"Standard": Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots.
"Special": Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support).
"Specific": Aircraft, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems and medical equipment for life support, etc.

The quality grade of NEC Electronics products is "Standard" unless otherwise expressly specified in NEC Electronics data sheets or data books, etc. If customers wish to use NEC Electronics products in applications not intended by NEC Electronics, they must contact an NEC Electronics sales representative in advance to determine NEC Electronics' willingness to support a given application.
(Note)
(1) "NEC Electronics" as used in this statement means NEC Electronics Corporation and also includes its majority-owned subsidiaries.
(2) "NEC Electronics products" means any product developed or manufactured by or for NEC Electronics (as defined above).
